

DrawCardMessage contains the player's token along with the row and the index of the card to be drawn.

The controller checks if it is the player's turn and if he can afford that card (in case that's a BuildingCard). If so, `Game.resolveAction(row, idx)` is called.

During `resolveAction()`, the Game checks if the player has already drawn all the cards he had to draw.

If not, the card is removed from the corresponding row, the player gets the card, which may trigger a series of double-dispatch calls for the effect of the card.

Each of the player's buildingCards then is notified that a card has been purchased, and depending of the Card's nature another series of double-dispatch calls may happend due to certain BuildingCards' effect
